

LiveFoldersFS – Architecture

FUSE filesystem · tools as plain files · no protocol, no SDK

Data flow

1. LLM echo "input" > .livefolders/tools/<name>/<endpoint> → FUSE write() accumulates in write_buf
 2. fd closes → FUSE release() → ExternalTool spawns shell handler (stdin=input, sandboxed) → stores in result_buf
 3. LLM cat .livefolders/tools/<name>/<endpoint> → FUSE read() → drains result_buf | .log companion → trace_buf
- read_invoke: invocation fires on read() instead of release() | state_file: flock serialises concurrent calls*
